

Award Software System Architecture

Made with AI

From Loan Default to Execution, Every Step Streamlined and Automated

Award Software – Multi-Step Legal Workflow Automation

Designed and implemented a large-scale .NET + SQL Server application (with MS Word/VBA macros) to automate arbitration and loan recovery processes for law firms and banks.

Key Features:

- **Data Import & Validation:** Loan data imported from Excel into staging tables, validated, then normalized into final tables. Handles borrower/guarantor constitution, loan type (secured/unsecured, cash credit vs term loan), repayment schedules, and collateral structures.
- **Document Generation Engine:** Automated fill-in-blanks across templates (Advocate Notices, Claims, Affidavits, Awards, EP filings). Conditional logic ensures correct clauses based on loan type and borrower setup.
- **Batch Processing:** Collates hundreds of RTF/Word documents into single stitched files for efficient printing. Batch headers and renumbering logic implemented for postal dispatch (PDS) and court filings.
- **Postal Workflow Integration:** Generates PDS lists, AD lists, bar-coded stickers, and tracks postal returns. Supports automated updates of postal reports.
- **Execution Petition Automation:** CSV-driven bulk generation of EP documents (Vakil Patra, Purshis, LOD, Summons, A3 petitions). Includes macros for formatting into A3 landscape layouts.

- **Error Management:** Exception handling with skipped reports, duplicate key detection, and validation of mandatory fields.

Tech Stack:

- .NET WinForms / Iron Speed Designer
- SQL Server (normalized schema, staging/dummy tables, batch headers)
- MS Word Macros (VBA for stitching, formatting, and automation)

This system spans months-long legal workflows, reducing manual intervention, ensuring compliance, and enabling law firms and banks to handle thousands of arbitration cases efficiently.
